

Day 6 – Tangent Properties – Practice

For problems 1-2, find the perimeter of each polygon.

1.

$P = 68$

2.

$P = 90.2$

3. Find the missing segment length.

$12^2 + 16^2 = c^2$

$400 = c^2$

$20 = c$

5. Solve for x.

$7x - 3 = 5x + 1$

$2x = 4$

$x = 2$

4. JG is the diameter of the circle whose radius is 11. If PG = 20 and JP = 30, is GP tangent to the circle?

$20^2 + 22^2 \stackrel{?}{=} 30^2$

$884 \neq 900$

No, GP is not tangent to the circle.

6. Given $CD = 3(2x-2)$ and $CB = -5x+16$, find mCD.

$3(2x - 2) = -5x + 16$

$6x - 6 = -5x + 16$

$11x = 22$

$x = 2$

$CD = 3(2 \cdot 2 - 2)$

20

$CD = 6$
